Customer Churn Analysis

Data Quality Review & Exploratory Findings | Prepared from the supplied 15-record sample

1. Dataset overview

Measure	Result
Records / fields	15 records / 11 fields
Missing cells	0
Duplicate CustomerIDs	0
Average age	39.07 years
Average tenure	18.80 months
Churned / retained	7 / 8
Churn / retention rate	46.67% / 53.33%
Sum of TotalCharges for churned records (dashboard ~3.11K KPI)	3,109.51 (currency not specified)
Sum of MonthlyCharges for churned records	409.93 (currency not specified)

2. Data quality checks

Check	Result
Missing values	No blank / null values found in the supplied table.
Duplicate customer IDs	No duplicate CustomerID values found.
TotalCharges consistency	MonthlyCharges × TenureMonths matches TotalCharges for all records within floating-point precision.
Observed value ranges	Age 23–60; tenure 2–48 months; support tickets 0–6.

3. Exploratory findings

The sample contains 7 churned customers (46.67%) and 8 retained customers (53.33%). In this dataset, all records marked as churned have a Month-to-Month contract, while no churn is recorded for One Year or Two Year contracts. This is an observation within a very small sample, not evidence that contract type causes churn or a reliable estimate of real-world churn risk.

The dashboard's approximately 3.11K KPI matches the sum of TotalCharges for churned records (3,109.51). The separate sum of MonthlyCharges for churned records is 409.93. Currency is not specified in the source. These are descriptive sums, not a forecast of lost revenue or lifetime value.

4. Suggested business questions

• For a larger dataset, compare churn rates across contract types, tenure bands, subscription tiers, payment methods, and support-ticket counts.

• Investigate whether customers with repeated support contacts are more likely to churn, while avoiding causal claims from simple group comparisons.

• Validate findings on a larger, representative dataset before making retention decisions.

5. Limitations and publication notes

This is a 15-record sample and is too small for robust generalization. No original external data source, sampling method, or currency was provided. The minimum–maximum ranges above describe observed values and do not establish statistical outliers. Confirm that the dataset contains no real or confidential customer information before making the repository public.

Tools: Excel / CSV for data review; Power BI for dashboard visualization. Metrics were recalculated from the supplied CSV.
